Application: Web Developer (Full Stack) (m/f/d) · Lachmann & Rink GmbH, Dortmund

PROFILE

Full stack web developer with 3+ years of experience designing and building web applications, REST APIs and the automation behind them: Node.js, TypeScript, Angular, MongoDB and MySQL, delivered through Docker and CI/CD. Technical lead on five internal platforms, where I define the interfaces between front end and back end and turn manual, ticket-driven processes into self-service web applications — including the administration of virtual infrastructure through the VMware vSphere API. I work directly with clients, QA and agile teams, and I document what I build well enough that the next developer can pick it up.

TECHNICAL SKILLS

Front end	Angular, TypeScript, JavaScript, HTML5, CSS3, Bootstrap, Leaflet (maps)
Back end & APIs	Node.js, Express.js, RESTful APIs, WebSockets (Socket.io), JWT authentication, role-based access control
Databases	MongoDB, MySQL — schema design, aggregation, query optimisation, indexing
Automation & VMware	VMware vSphere REST API — VM provisioning from templates, cloning, snapshots, power state, host / cluster / datastore metrics
DevOps & cloud	Docker, CI/CD (Jenkins, GitHub Actions), AWS, Linux, automated testing
Mobile	Flutter (Dart), including offline synchronisation
IoT & protocols	MQTT, ESP32, Raspberry Pi, Python
Tools & methods	Git, Postman, Agile/Scrum, ClickUp, technical documentation

PROFESSIONAL EXPERIENCE

Full Stack Developer (MEAN Stack) / Technical Lead

Jan 2023 – Present

Prologic Tunisie

- Designed and built the back end of three internal business applications (resource management, project management, ticketing) with Node.js, Express.js and MongoDB, each with an Angular front end used daily by operations, project and support teams.
- Defined and documented the REST API contracts between front end and back end, so that web and Flutter clients could be developed in parallel with the back-end work instead of waiting for it.
- Implemented JWT authentication and role-based access control (Admin, Manager, User) across all applications, including approval workflows and per-role data visibility.
- Added real-time behaviour with Socket.io — live resource availability, in-app notifications and ticket updates — replacing manual refreshes and internal e-mail round trips.
- Set up Dockerised environments and Jenkins CI/CD pipelines with automated tests, so every build and deployment ran the same way and releases stopped depending on one person’s machine.
- Built web tools on the VMware vSphere REST API — provisioning and cloning virtual machines from templates, managing snapshots and power state, and reading host, cluster and datastore metrics — so routine infrastructure work became a form instead of a ticket to the one person with vCenter access.
- Optimised database queries and application performance, keeping dashboards responsive as data volumes grew.
- Worked day to day with front-end developers, QA and business stakeholders in an agile team: clarified requirements, kept scope realistic and documented decisions in a central knowledge base.

Freelance Full Stack Developer

Mar 2021 – Present

Self-employed

- Built custom web applications end to end for small businesses — admin dashboards, booking systems, task managers and expense trackers — with Node.js, Express.js, MongoDB and Angular.
- Gathered requirements directly with clients, turned them into data models and REST APIs, and deployed the finished application to production.
- Provided ongoing maintenance and support after go-live, including the changes clients needed as their business and processes evolved.

SELECTED PROJECTS

The four I would be glad to be interviewed about, followed by the rest in brief.

Data Center Automation Portal

Node.js · Express.js · VMware vSphere API · Angular · MongoDB · Docker

Web application that automates routine data center work: virtual machines provisioned from templates, cloned and snapshotted, power state changed, and host, cluster and datastore information read through the vSphere API.

Role: vSphere API integration, job queue for long-running operations, permission model, Angular UI.
Impact: infrastructure requests became a form with a status and an audit trail instead of an e-mail to whoever held the credentials.

Lab Environment Manager

Node.js · Express.js · vSphere API · MongoDB · Angular · Jenkins

Self-service portal for training and test labs: a colleague selects an environment, the application builds the VM set from templates, hands over addresses and credentials, and removes everything again on a schedule.

Role: environment templates, provisioning workflow, quota and expiry rules.
Impact: capacity consumed by forgotten lab machines became visible and finite, and nobody waits for someone else to build their environment.

Server & Storage Monitoring

Node.js · vSphere API · MySQL · Socket.io · Angular

Dashboard over host, cluster and datastore metrics — CPU and memory pressure, free space, snapshot sprawl, machines powered on but idle — with history so capacity questions are answered from data.

Role: metric collection, retention strategy, threshold rules, dashboard design.
Impact: datastores filling up and snapshots growing unnoticed for weeks became visible before they caused an outage.

Ticketing & Resource Management System

Node.js · Express.js · MongoDB · Angular · Socket.io · JWT · Docker · Jenkins

Internal ticketing for support and operations: priorities and status flow, workload management across teams, reporting, real-time updates and automated e-mail notifications.

Role: technical lead — data model, REST API, real-time layer, CI/CD, documentation.
Impact: a centralised knowledge base for recurring issues cut handling time and stopped the same problems being solved twice.

Further projects

Resource Management Dashboard — real-time availability and approval workflows for vehicles, rooms and employees
Node.js · MongoDB · Angular · Socket.io · Docker

Project Management Dashboard — task boards, roles and project analytics, plus a Flutter app with offline synchronisation
Node.js · Angular · Socket.io · Flutter · Jenkins

Internal Reporting & KPI Service — scheduled summaries of workload, utilisation and throughput on a separate read path
Node.js · MongoDB · aggregation · JWT

Data Center Monitoring Dashboard (IoT) — sensor readings to live dashboard, threshold alerting and historical storage
Node.js · MQTT · ESP32 · Raspberry Pi · MongoDB

EDUCATION

Web & Mobile Engineering 2020 – 2023
Tek-Up University

Information Systems Development 2016 – 2019
ISET Sfax

Computer Science Baccalaureate 2015 – 2016
Bardo High School

LANGUAGES

Arabic: native · English: intermediate (B2) · French: intermediate

STRENGTHS

Technical ownership, clear documentation and interface design, automating manual processes, communication with non-technical stakeholders, calm problem-solving when requirements move

AVAILABILITY

Based in Hagen, North Rhine-Westphalia — Dortmund reachable within about 40 minutes; available full time, on site or hybrid.
