PROFILE

Full stack developer with three years of experience in web applications and the APIs behind them. I work with Node.js, TypeScript and Angular, and with MongoDB and MySQL. In my current role I am technical lead on five internal platforms: I agree the interfaces with the front-end team, take features through Docker and CI/CD into production, and keep the documentation good enough that colleagues can pick the work up. A large part of that is turning manual processes into web applications, most recently for administering virtual infrastructure over the VMware vSphere API.

TECHNICAL SKILLS

Front end	Angular, TypeScript, JavaScript, HTML5, CSS3, Bootstrap, Leaflet (maps)
Back end & APIs	Node.js, Express.js, RESTful APIs, WebSockets (Socket.io), JWT authentication, role-based access control
Databases	MongoDB, MySQL (schema design, aggregation, query optimisation, indexing)
Automation & VMware	VMware vSphere REST API: VM provisioning from templates, cloning, snapshots, power state, host / cluster / datastore metrics
DevOps & cloud	Docker, CI/CD (Jenkins, GitHub Actions), AWS, Linux, automated testing
Mobile	Flutter (Dart), including offline synchronisation
IoT & protocols	MQTT, ESP32, Raspberry Pi, Python
Tools & methods	Git, Postman, Agile/Scrum, ClickUp, technical documentation

PROFESSIONAL EXPERIENCE

Full Stack Developer (MEAN Stack) / Technical Lead

Jan 2023 – Present

Prologic Tunisie

- Built the back end of three internal applications (resource management, project management, ticketing) with Node.js, Express.js and MongoDB. Operations, project and support teams use them every day.
- Wrote the API contracts down before implementation, so the web and Flutter clients could be built in parallel and did not have to wait for the back end.
- Set up JWT authentication and role-based access control (Admin, Manager, User) across all applications, including approval workflows and per-role data visibility.
- Used Socket.io for live resource availability, in-app notifications and ticket updates. This removed a lot of manual refreshing and internal e-mail.
- Containerised the applications with Docker and set up Jenkins pipelines with automated tests, so builds and deployments no longer depended on one person’s machine.
- Built web tools on the VMware vSphere REST API for provisioning and cloning VMs from templates, snapshots, power state, and host, cluster and datastore metrics. Routine infrastructure work became a form instead of a ticket to the one colleague with vCenter access.
- Tuned queries and data access when dashboards started to slow down as the data grew.
- Worked closely with front-end developers, QA and the business side. Clarified requirements, pushed back when scope grew, and wrote decisions into a knowledge base.

Freelance Full Stack Developer

Mar 2021 – Present

Self-employed

- Built small web applications for businesses: admin dashboards, booking systems, task managers, expense trackers. Stack was Node.js, Express.js, MongoDB and Angular.
- Talked requirements through with the clients myself, then designed the data model and the API and deployed the result.
- Stayed on for maintenance and support after go-live.

SELECTED PROJECTS

The four I would be glad to be interviewed about, followed by the rest in brief.

Data Center Automation Portal

Node.js · Express.js · VMware vSphere API · Angular · MongoDB · Docker

Web application that automates routine data center work: virtual machines provisioned from templates, cloned and snapshotted, power state changed, and host, cluster and datastore information read through the vSphere API.

Role: vSphere API integration, job queue for long-running operations, permission model, Angular UI.
Impact: requests became a form with a status and an audit trail.

Lab Environment Manager

Node.js · Express.js · vSphere API · MongoDB · Angular · Jenkins

Self-service portal for training and test labs: a colleague selects an environment, the application builds the VM set from templates, hands over addresses and credentials, and removes everything again on a schedule.

Role: environment templates, provisioning workflow, quota and expiry rules.
Impact: forgotten lab machines stopped eating capacity, and nobody waits for someone else to build an environment.

Server & Storage Monitoring

Node.js · vSphere API · MySQL · Socket.io · Angular

Dashboard over host, cluster and datastore metrics: CPU and memory pressure, free space, snapshot sprawl, machines powered on but idle. History is kept so capacity questions are answered from data.

Role: metric collection, retention strategy, threshold rules, dashboard design.
Impact: full datastores and unnoticed snapshot growth became visible before an outage.

Ticketing & Resource Management System

Node.js · Express.js · MongoDB · Angular · Socket.io · JWT · Docker · Jenkins

Internal ticketing for support and operations: priorities and status flow, workload management across teams, reporting, real-time updates and automated e-mail notifications.

Role: technical lead for data model, REST API, real-time layer, CI/CD and documentation.
Impact: a centralised knowledge base for recurring issues cut handling time and stopped the same problems being solved twice.

Further projects

Resource Management Dashboard : real-time availability and approval workflows for vehicles, rooms and employees
Node.js · MongoDB · Angular · Socket.io · Docker

Project Management Dashboard : task boards, roles and project analytics, plus a Flutter app with offline synchronisation
Node.js · Angular · Socket.io · Flutter · Jenkins

Internal Reporting & KPI Service : scheduled summaries of workload, utilisation and throughput on a separate read path
Node.js · MongoDB · aggregation · JWT

Data Center Monitoring Dashboard (IoT) : sensor readings to live dashboard, threshold alerting and historical storage
Node.js · MQTT · ESP32 · Raspberry Pi · MongoDB

EDUCATION

Web & Mobile Engineering 2020 – 2023
Tek-Up University

Information Systems Development 2016 – 2019
ISET Sfax

Computer Science Baccalaureate 2015 – 2016
Bardo High School

LANGUAGES

Arabic: native · English: intermediate (B2) · French: intermediate

STRENGTHS

Ownership of a feature from requirement to production, clear documentation, automating manual work, explaining technical trade-offs to non-technical colleagues

AVAILABILITY

Based in Hagen, North Rhine-Westphalia. Dortmund is about 40 minutes away. Available full time, on site or hybrid.
